Space Weather Forecast

Issued on Friday, 25 March 2022 at 12:46 Local

This forecast provides a four day assessment of space weather events. The probabilities stated below are for reaching or exceeding the given levels. For more information about space weather impacts please see the Met Office Space Weather Scales https://www.metoffice.gov.uk/weather/learn-about/space-weather/uk-scales

---

Space Weather Forecast Headline: Chance R1/R2 Radio Blackouts throughout. Chance G1/Minor Storms day 2 and 3 (26th and 27th).

Analysis of Space Weather Activity over past 24 hours

Solar Activity: Solar activity has been Moderate over the last 24 hours with one Moderate-class flare from AR2974 in the southeast. There are three numbered regions on the disk, all in the eastern hemisphere. No Earth-directed Coronal Mass Ejections (CMEs) were observed in the last 24 hours, though we are waiting for more imagery before analysing the CME from the M flare.
Solar Wind / Geomagnetic Activity: The solar wind is declining as the effects of a coronal hole wane. The Earth's magnetic field (Bt) has been weak, as has the north-south component (Bz). Consequently geomagnetic activity has remained Quiet to Unsettled.

Energetic Particles / Solar Radiation: The count rate of energetic particles (high energy protons) was at background with no solar radiation storms observed.

Four-Day Space Weather Forecast Summary

Solar Activity: Common-class X-ray flares are expected in the period, with a daily chance of further moderate-class. Further sunspot regions are also expected to rotate onto the facing side over the next four days, with the outlook potentially seeing an increase in flare risk - the degree to which this occurs pending these arrivals for analysis.

Solar Wind / Geomagnetic Activity: A CME from the moderate flare at 25/0526 UTC will be analysed for any Earth-directed component once more imagery becomes available, beyond that there are no other Earth-directed CMEs in the forecast. Current slightly-elevated solar winds are forecast to decline day 1 and 2 (25th/ 26th), before the arrival of further fast winds from CH69 later day 2 (26th). Solar winds are likely to become elevated, before easing again later day 3 and day 4 (27th and 28th). Quiet, to Unsettled geomagnetic activity at first is expected to become Active with a chance of G1/Minor Storm intervals later day 2 and day 3 (26th/27th), before easing to Quiet to Unsettled day 4 (28th).

Energetic Particles / Solar Radiation: The count rate of energetic particles (high energy protons) is forecast to be at background with no solar radiation storms occurring. There is a very slight chance of count rates increasing however, due to the moderately sized sunspot in the northeast, should any large flares occur. Although this region is currently in an unfavourable location for producing solar radiation storms at Earth.

Space Weather Forecast

Geomagnetic Storms:

Geo-Magnetic Storm Probability (Exceedance)	Level	Past 24 Hours (Yes/No)	Day 1 (00-24 UTC) (%)	Day 2 (00-24 UTC) (%)	Day 3 (00-24 UTC) (%)	Day 4 (00-24 UTC) (%)
Minor or Moderate	G1 to G2	No	1	40	30	1
Strong	G3	No	1	1	1	1
Severe	G4	No	1	1	1	1
Extreme	G5	No	1	1	1	1

Radio Blackouts - X Ray Flares:

X Ray Flares Probability	Level	Past 24 Hours (Yes/No)	Day 1 (00-24 UTC) (%)	Day 2 (00-24 UTC) (%)	Day 3 (00-24 UTC) (%)	Day 4 (00-24 UTC) (%)
Active	R1-R2 M Class	Yes	25	25	25	25
Very Active	R3 to R5 X	No	2	2	2	2

Solar Radiation Storms - (High Energy Protons):

Radiation Storms Probability (Exceedance)	Level (cm^{-2} sr^{-1} s^{-1})	Past 24 Hours (Yes/No)	Day 1 (00-24 UTC) (%)	Day 2 (00-24 UTC) (%)	Day 3 (00-24 UTC) (%)	Day 4 (00-24 UTC) (%)
Active	≥ S1	No	2	2	2	2
Very Active	≥ S3 *	No	1	1	1	1
* S3 ≥ 10 MeV ≥ 1000 pfu and / or ≥ 50 MeV ≥ 10 pfu. (pfu = $cm^{-2}sr^{-1}s^{-1}$)
